

CSS GROUP ASSIGNMENT

Responsive Client Website with AI-Assisted Development

You are working as a small front-end development team.

Your client(ME 😊) owns an imaginary company. Your team may decide what the company does, what services or products it offers, and who its target audience is.

The client will provide:

- a rough design for the landing page;
- the required color palette;
- the required Roboto font;
- information about font sizes, font weights and visual hierarchy;
- basic expectations for the responsive version of the website.

Your task is to turn the provided design into a complete, responsive website consisting of approximately three or four pages.

The landing page should follow the provided design as closely as reasonably possible. Your team may design the remaining pages according to your own ideas, but all pages must look like parts of the same website.

Landing Page

The landing page must follow the client's rough design.

Your team should carefully study the provided design and identify:

- the main sections of the page;
- the visual hierarchy;
- the typography;
- the required font sizes and font weights;
- the colors and background colors;
- the spacing between elements;
- the alignment and position of content;
- how the desktop layout should change on smaller screens.

The design does not have to be pixel-perfect, but the final result should clearly represent the provided client design. The content of the website may be changed to match the imaginary company selected by your team.

See the example of how I want my Landing page to look like:

Also, I want you to follow these instructions for **typography** based parts of the website:

colors and font styles

dark background color (hero and footer)
#1F2937

Hero Main text ("this website is awesome")
48px extra-bold #F9FAF8

Hero Secondary text, Header Link Text
18px #E5E7EB

Header Logo Text
24px #F9FAF8

Button color, call to action background color
#3882F6

information header text
36px extra-bold #1F2937

Quote section background color
#E5E7EB

Quote text
36px light italic #1F2937

The remaining pages may be designed according to your team's ideas. Although you have more creative freedom on these pages, they must remain visually consistent with the landing page.

Technical Requirements

The project must use:

- semantic HTML;
- vanilla CSS;
- at least one external CSS stylesheet;
- Flexbox for the main page layouts;
- media queries;
- responsive images;
- the [Roboto](#) font;
- [Import the Roboto font](#);
- a shared navigation and footer;
- a CSS-only burger menu on smaller screens;
- a collaborative GitHub repository.

IMPORTANT: CSS Grid is **not** allowed in this assignment. JavaScript is **not** allowed, including for the burger menu(it must be made using only HTML & CSS). You may import and use Roboto. Font Awesome is the only CSS library permitted, and it may be used only for icons.

Responsive Design

The website must be responsive and usable on different screen sizes. Test the website at approximately the following widths:

- Mobile: 375px
- Tablet: 768px
- Desktop: 1200px or wider

At different screen sizes:

- content must not overflow horizontally;
- text must remain readable;
- images must fit inside their containers;
- Flexbox layouts should reorganize when necessary;
- navigation must change into a burger menu on smaller screens;
- all pages must remain usable;
- sections should not overlap;
- important content should not disappear.

The mobile version does not need to look exactly like the desktop version. The layout should adapt according to the available space.

On smaller screens, the normal desktop navigation must be replaced by a **burger menu**. The burger menu must be created using only HTML and CSS.

JavaScript is not allowed!

Your team should research possible CSS-only solutions, select an appropriate approach, test it at different screen sizes and understand how the final solution works.

AI may help you research and understand this feature, but your team must first discuss possible solutions and attempt to understand the problem independently.

Responsive Images

The browser should be able to load or display an appropriate image according to the user's screen size, resolution or layout.

Depending on the purpose of the image, your team may use:

- `<picture>` and `<source>`;
- `srcset` and `sizes`;
- CSS media queries for decorative background images;
- another appropriate responsive image solution.

Your team must explain why the selected technique was appropriate for that image. All regular content images should also resize correctly inside their containers without becoming stretched or distorted.

Using AI During Development

AI should be used as a development assistant, not as a replacement for your team. Follow this process:

Think → Try → Ask AI → Understand → Test → Accept, Modify or Reject

Your team must use AI during at least four different stages of the project. After your initial team meeting, use AI to review or expand your ideas.

Ask AI to explain the concept, not only to provide finished code. Do not ask AI to fix a problem before your team has attempted to understand it. Near the end of the project, ask AI to review part of your work. Your team must decide which suggestions are useful.
